Strain-defect interaction in oxides

am

Mittwoch, 11. März um 16:30

Technische Universität Wien, Chemie Hochhaus
Bauteil BA Chemie Hochhaus, GM 3 Vortmann Hörsaal, 02. Stock
1060 Wien, Getreidemarkt 9

Abstract:

It recently became apparent that epitaxial strain in perovskite thin films or heterostructures can not only be accommodated by changes in structural parameters such as bond-lengths or octahedral rotation angles, but also by the formation of point defects^{1,2}. In this talk we will, after a general introduction, explore the generality of this concept for perovskite oxides of different compositions and with different functionalities as well as in binary rock-salt oxides. Based on our density functional theory calculations of the strained materials, the resulting point-defect-induced changes in properties such as the ionic and electronic conductivity, ferroelectricity and magnetism will be discussed.
